## **- Categories and Modalities of Uncertainty -**

**5 th International Workshop  
on Soft Computing Applications**

**22-24 August, 2012**

**Szeged, Hungary**

**Michio Sugeno**

**Mieres-Asturias, Spain**

# Content

- **Motivation and Methodology**
- **Some Issues of Language**
- **Evidentness in Cartesian Philosophy**
- **Categories and Modalities of Uncertainty**
- **Three Essential Uncertainties**
- **Structure of Uncertainty**
- **Conclusions and Future Studies**

# Motivation

- **Fuzzy theory has brought a hidden uncertainty, fuzziness, to light which is interpreted as uncertainty concerning the meaning of wording.**
- **Wording has three kinds of uncertainty, viz., ambiguity, fuzziness and nonspecificity (take ‘that book’; put it ‘there’).**

# Ambiguity and Fuzziness

**Up and Down (Lithograph 1947)**

## Escher (1898 - 1972)

**Day and Night (Woodcut 1938)**

# Motivation

- Fuzzy theory has brought a hidden uncertainty, fuzziness, to light which is interpreted as uncertainty concerning the meaning of wording.
- Wording has three kinds of uncertainty, viz., **ambiguity**, **fuzziness** and **nonspecificity** (take ‘that book’; put it ‘there’).
- So far, only ambiguity has been considered in natural language processing. Fuzziness is, however, a much more dominant uncertainty than both ambiguity and nonspecificity.

A fundamental question is:

“What kinds of uncertainty are we aware of?”

**How can we answer this question ?**

# Methodology of Finding Uncertainties (1)

**According to Saussure (1857-1913), the father of modern linguistics, we perceive and think about the world outside us and inside us with language.**

**We articulate the continuous world into a manageable number of clusters in our perception: discretization of the continuous world with ‘**language of articulation**’.**

**For instance, a rainbow as a continuous optical spectrum is articulated into a number of colors depending on cultures: **two in C. African Republic, three in Zimbabwe, five in Zuni Indian, six in UK & USA or seven in France, Spain & Japan.****

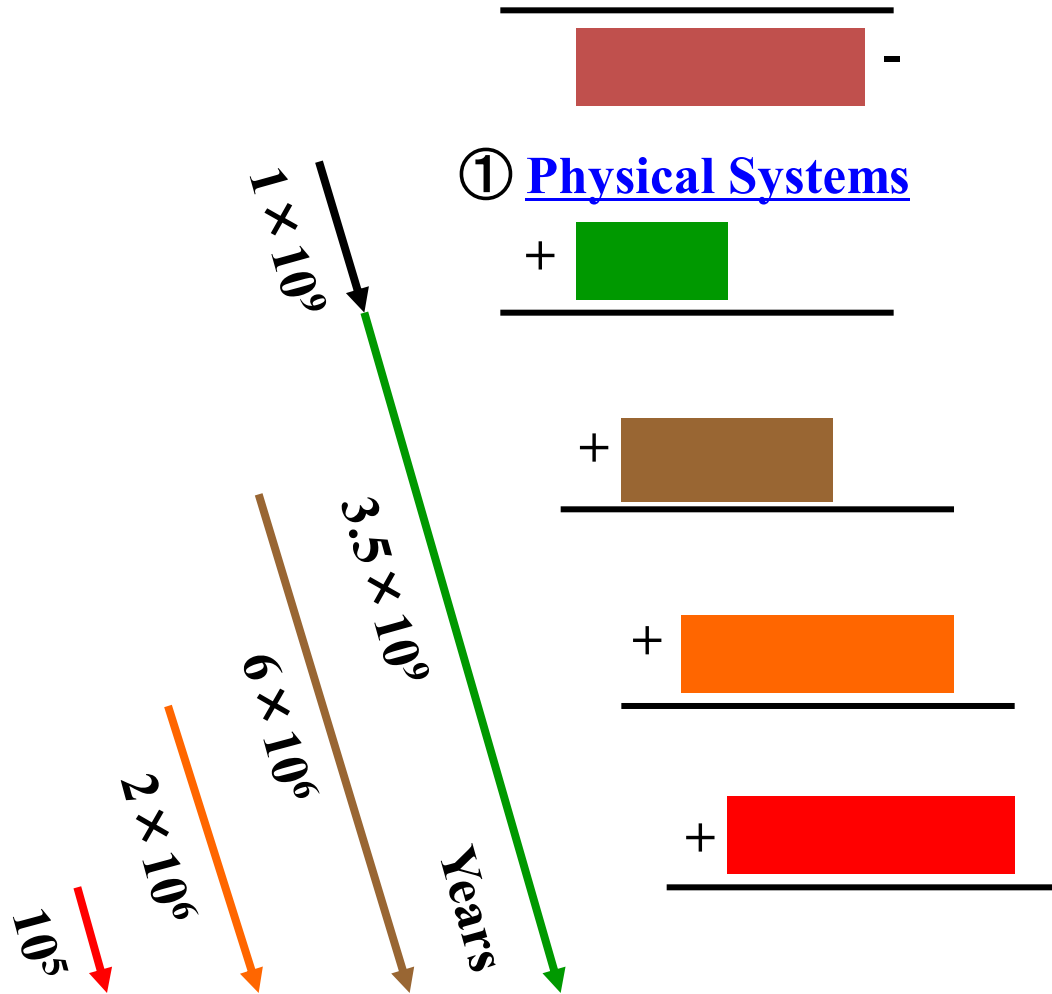

**Language records in it all the experiences that our species have ever encountered over 100 thousands of years since the brain created modern language.**

# Development of Human Language

## Halliday (1975) & Matthiessen (2004)

<b>Human Species</b>	<b>2 M years ago</b> <b>homo habilis</b>	~ <b>homo</b> <b>gramma-</b> <b>ticus</b>	<b>100 K years ago</b> <b>homo sapience</b> <b>sapience</b>

# Typology of Systems: Language is the System of the Highest Order

# Three Body-Problem in Physics

Two particular solutions are known:

- (1) Euler's collinear solution in 1765,
- (2) Lagrange's equilateral triangle solution in 1772.

Poincare proved that the problem cannot be analytically solved in 19 C.

'Three' is complex in physics !

**K. Yamada and H. Asada gave a collinear solution in the setting of general relativity theory in October, 2010.**

PHYSICAL REVIEW D **82**, 104019 (2010)

**Collinear solution to the general relativistic three-body problem**

Kei Yamada and Hideki Asada

*Faculty of Science and Technology, Hirosaki University, Hirosaki 036-8561, Japan*

(Received 31 May 2010; published 8 November 2010)

The three-body problem is reexamined in the framework of general relativity. The Newtonian three-body problem admits *Euler's collinear solution*, where three bodies move around the common center of mass with the same orbital period and always line up. The solution is unstable. Hence, it is unlikely that such a simple configuration would exist owing to general relativistic forces dependent not only on the masses but also on the velocity of each body. However, we show that the collinear solution remains true with a correction to the spatial separation between masses. Relativistic corrections to the Sun-Jupiter

# Two Mistakes in Approaching Language

## 1. A historical mistake:

Russel and Whitehead dreamed to creat an ideal language since ordinary language looked so impresice or vague ( 'loose concept' in the sense of Frege) to them.

Their dream was, however, broken when Wittgenstein stated:

**“Ordinary language is perfect as it is.”**

**Known as ‘the Linguistic Turn’.**

## 2. A recent mistake:

AI people take a logical and symbolic approch to Language.

**Their efforts will be not fruitful.**

## Methodology for Finding Uncertainties (2)

- Found out all the adjectives implying uncertainty by carefully reading Dictionaries of English and Japanese from the first page to the last (in 1986).

**There were found 170 in English and 150 in Japanese.**

- Then, found out Chinese adjectives by using Japanese-Chinese Dictionary; French and German adjectives as well.

**There were found 160 in Chinese, 150 in French & German.**

- Last year (in 2011), found out Spanish adjectives referring to both English-Spanish and Japanese-Spanish Dictionaries, and Basque as well. Also recounted English and French adjectives.

# Japanese Adjectives (1)

# French Adjectives (4)

**voilé**

**vraisemblable**

**Total 182**  
**(Sugeno 1986,**  
**2011)**

## Three Dominant Adjectives

English	uncertain, obscure, vague	fuzzy
Japanese	不確か(futashika-na), 曖昧な(aimai-na), 漠然とした(bakuzento-shita)	ファジィ (fuzzy)
Chinese	不确定, 模糊, 含糊	模糊
French	incertain, obscure, vague	flou
German	unsicher, unklar, dunkel	fuzzy
Spanish	dudoso, oscuro, vago	borroso
Basque	ilun, itsurazko, zalantazko	lausoa

Dominant adjectives in a language can be found by translating them into another language belonging to a different language family.

For instance, **oscuro** in Spanish is translated into English: **dark, obscure, deep, dim, shadowy, dusky, gloomy, murky, dusk, dingy, darkling, darksome, twilight, abstruse, insignificant, vat, pitchy, eery, dissolute, cimmerician, murk, mirk** : 22 English adjectives.

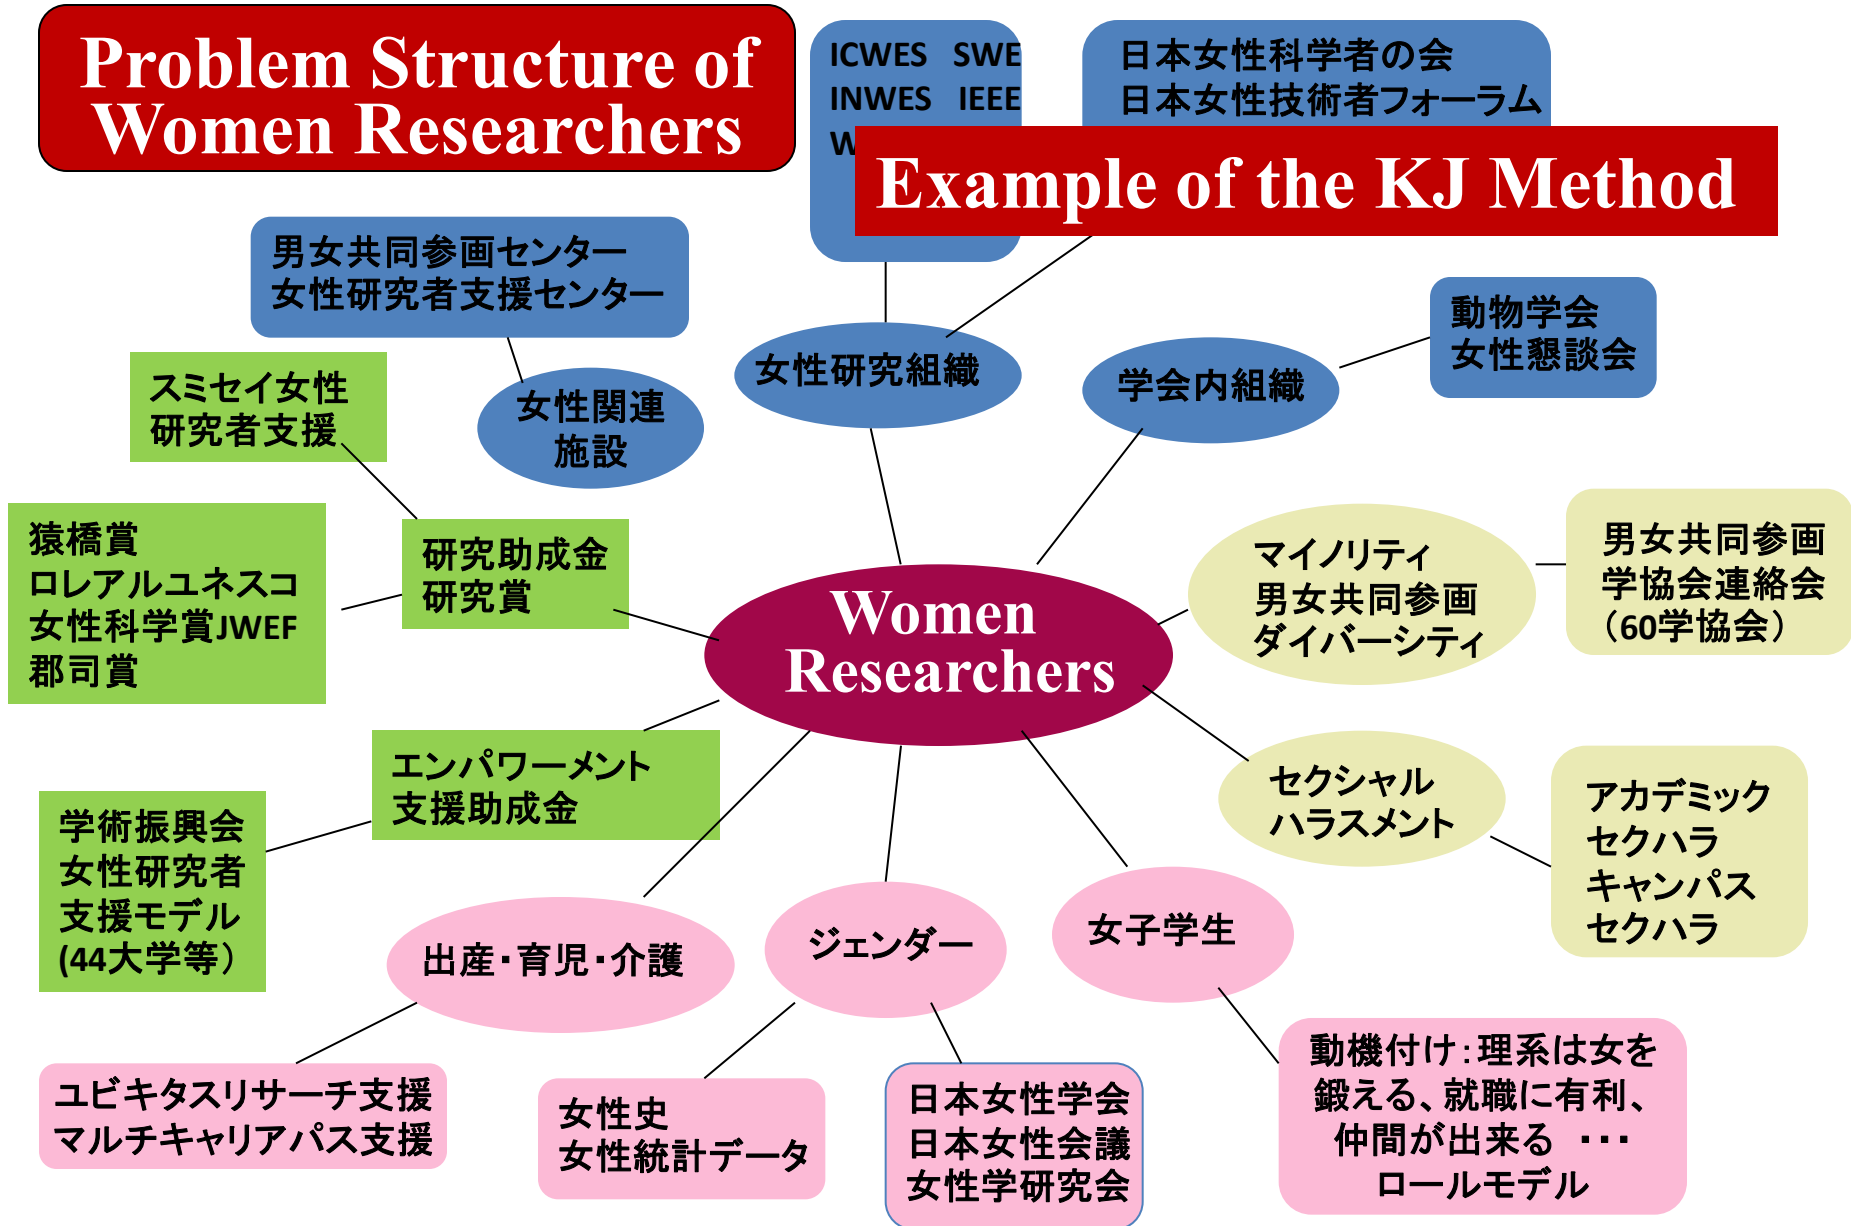

# Categories and Modalities of Uncertainty

We use ‘uncertainty’ and ‘uncertain’ as the most general terms in this study.

Classified the collected adjectives by the KJ method into groups and assign a name to a core-entity which adjectives of a group are intended to → **category of uncertainty.**  
Assigned a modality to a group of adjectives. → **modality.**

# Problem Structure of Women Researchers

## Example of the KJ Method

# Categories and Modalities of Uncertainty

We use ‘uncertainty’ and ‘uncertain’  
as the most general terms.

Classified the collected adjectives by the **KJ method** into groups and assign a name to a core-entity which adjectives of a group are intended to → **category of uncertainty**.  
Assigned a modality to a group of adjectives. → **modality**.

For instance, ‘**Existence**’ is a category of uncertainty and the modality of it is named ‘**Non-evidentness**’ with reference to Cartesian philosophy.

Adjectives concerning **Non-evidentness of Existence** are:  
**blurred, chotic, disorderly, disputable, doubtful, fictious, imaginary, impenetrable, inapprehensible, inconspicuous, indescriable, inexpressible, indistinct, limitless, obscure, unclear, etc.**

# Evidentness (1)

In Cartesian philosophy, 'evidentness' implies both clearness and distinctness. If a concept is given an extensional definition, it is called 'clear', and if it is given an intentional definition, it is called 'distinct'.

Extensional definition:  $E = \{ 0, 2, 4, \dots \}$ ; clear

Intentional definition:  $E = \{ n \mid n \text{ is even} \}$ ; distinct

'Evidentness' is the first principle of **Methodology of Science** postulated by Descartes :

- (1) evidentness,
- (2) analysis,
- (3) synthesis,
- (4) enumeration.

**The first principle claims that we should only deal with evident facts in science.**

## Evidentness (2)

In his “Philosophical Investigation”, Wittgenstein precisely states that the meaning of a word is essentially not evident: neither clear nor distinct.

“How is the concept of a game bounded? ----  
The concept ‘game’ is a concept with blurred edge.”

→ implies that the concept of a game is **not clear**.

“Family resemblance of a word: Consider for examples the proceedings that we call games. ----  
You will not see something that is common at all.  
But similarities, relationship, ----.”

→ implies that the meaning of a word is **not distinct**.

The meaning of a word is contradictory to the first principle of Cartesian methodology; it is not an object science. **A logical approach will be never successful.**

# Concept of Small Number

Define  $S$  as a set of small numbers in  $\{1, 2, \dots, 10\}$ :

(i)  $S = \{1, 2, 3, ??\}$ ;  $S$  cannot be extensionally defined.  
→ **not clear.**

(ii)  $S = \{n \mid n \text{ is small}\}$ ; It is a tautology.  $S$  cannot be intentionally defined. → **not distinct.**

The concept of small number is **not evident** in the sense of Cartesian philosophy. Therefore, a small number cannot be an object of science; It is right when conventional scientists say “fuzzy theory is not science.”

**The problem was, however, solved by fuzzy sets.**

In a fuzzy set:  $\text{Small} = 1/1 + 0.9/2 + 0.7/3 + 0.4/4 + 0.1/5$ ;  
**quantitative intention / extension of  $\{1, 2, \dots, 10\}$**

## Paradox of Small Number

Let  $N = \{1, 2, \dots, 100\}$  be a universe of discourse.  
Consider the following assertions in binary valued logic:

- (i) 1 is a small number.
- (ii) A small number added by 1 is also a small number.

Then, we conclude that any number, e.g., 100 is small.

**This is not acceptable.**

Therefore, there is something wrong about the assertions.  
Since (i) is correct, (ii) must be wrong. That is, there may exist a certain number  $n^*$  such that  $n$  is small if  $n \leq n^*$ , and otherwise, not small.

**Neither this is acceptable.**

**Hence, the assertions cause a paradox.**

## Paradox of Small Number

Let  $N = \{1, 2, \dots, 100\}$  be a universe of discourse.  
Consider the following assertions in binary valued logic:

- (i) 1 is a small number.
- (ii) A small number added by 1 is also a small number.

Then, we conclude that any number, e.g., 100 is small.

**This is not acceptable.**

Therefore, there is something wrong about the assertions.  
Since (i) is correct, (ii) must be wrong. That is, there may exist a certain number  $n^*$  such that  $n$  is small if  $n \leq n^*$ , and otherwise, not small.

**Neither this is acceptable.**

**Hence, the assertions cause a paradox.**

## Small Number in Fuzzy Logic

Define  $P_n$ : “n is a Small Number” and S: a fuzzy set “Small Number” associated with a membership function  $S(n)$ .

The assertions are now rewritten: (i)  $P_1$  and (ii)  $P_n \rightarrow P_{n+1}$ .

Let  $|P_n| = S(n)$  conventionally, then apparently  $|P_1| = 1$ .

Since (ii) is not completely true, set  $|P_n \rightarrow P_{n+1}| = 1 - 0.01$ .

Let  $|P_n \rightarrow P_{n+1}| = (1 - |P_n| + |P_{n+1}|) \wedge 1$  in Lukasiewicz logic.

Then, it follows that  $|P_2| = 1 - 0.01$  and  $|P_3| = 1 - 0.02$ .

Solving the equation recursively, we obtain  $|P_n| = 1 - 0.01n$ .

Therefore, the membership function is now found to be

$$S(n) = 1 - 0.01n, \text{ where } S(0) = 1 \text{ and } S(100) = 0.$$

**Two assertions are a definition of Small Number!**

# Categories, Modalities and Adjectives

<b>Categories</b>	<b>Modalities</b>	<b>Adjectives</b>
<b>C1A: Existence</b> <b>C1B: Phenomenon</b>	<b>M1A: Non-evidentness</b> <b>M1B: Probability</b>	<b>various. chaotic</b> <b>aleatoric, probable</b>

<b>C7A: Logic</b>	<b>None</b>
<b>C7B: Form</b>	<b>None</b>

# On Modalities

<b>Modalities</b>	<b>Note</b>
<b>Non-evidentness of Existence Probability of Phenomenon</b>	<b>From Cartesian philosophy. No other choice.</b>
<b>Vagueness of Consciousness</b>	<b>No other choice.</b>
<b>Fuzziness of Wording</b>	<b>Unclearness is a choice.</b>
<b>Non-distinctness of Cognition</b>	<b>From Cartesian philosophy.</b>
<b>Nondeterminicity of Action/ Behaviour</b>	<b>Indeterminicity can be an alternative choice.</b>
<b>Uncertainty of Knowledge/ Information</b>	<b>Better than Incompleteness.</b>
<b>Illogicalness of Logic Inconsistency of Form</b>	<b>Non-rationality is a choice. Better than Incompleteness.</b>

# Essential Uncertainties

**Incompleteness of Form:** approximate, complex, different, disharmonious, disorderly, diverse, equivocal, free, imperfect, improper, inapposite, incomplete, incongruent, inconsonant, inconstant, incorrect, indefinite, indistinguishable, irregular

**69% with negative prefixes of 35 adjectives:**

**Vagueness of Consciousness:** absent, anxious, blankly, blurred, changeable, confusing, dark, deceptive, dim, doubtful, dreamy, dubious, evasive, faint, hazy, imaginative, incredulous, indescribable, inexplicable, obscure, vague, wooly, woozy

**6% with a negative prefix of 35 adjectives:**

**What do these mean?**

**‘Consciousness’ is uncertain in its natural state, while ‘form’ is certain in its natural state.**

# Three Essential Uncertainties and Their Mathematical Theories

## (1) Probability of Phenomenon

Probability theory: Pascal and Fermat (17 C).

## (2) Fuzziness of Wording

Fuzzy set theory: Zadeh (1965).

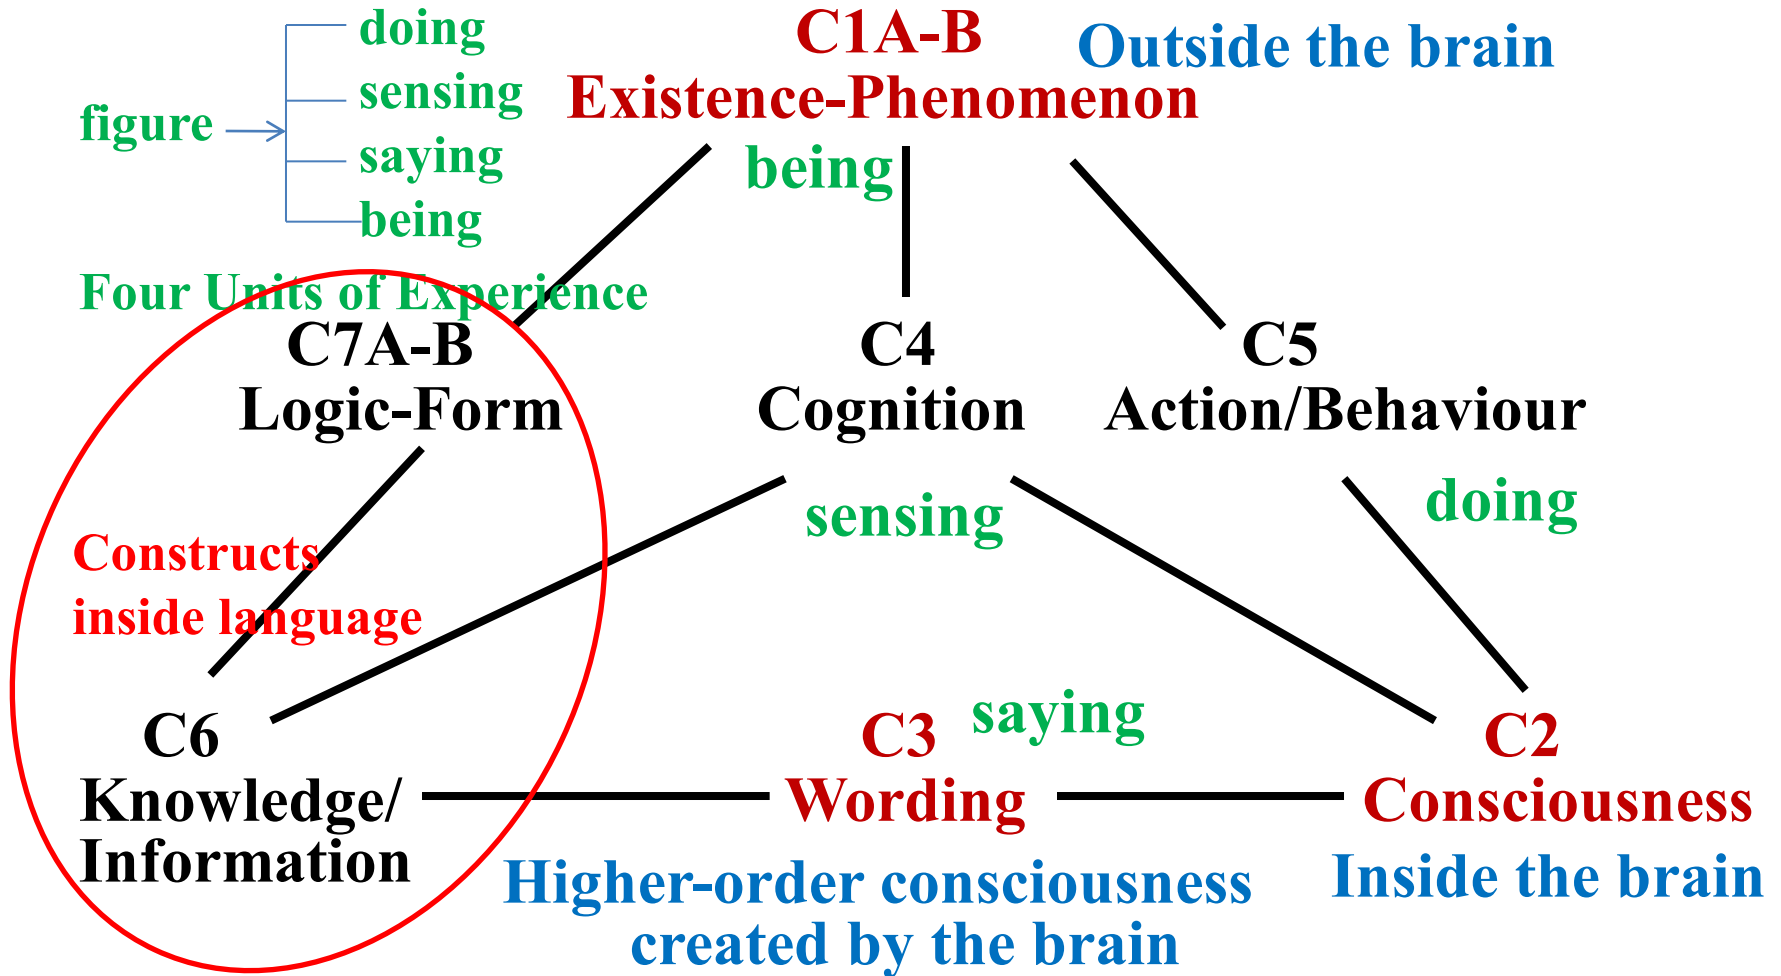

## (3) Vagueness of Consciousness

The ultimate uncertainty for our species ?

No mathematical theory ?

**Theorization of human consciousness  
would be impossible.**

# Structure of Uncertainty (Sugeno 1986, 2011)

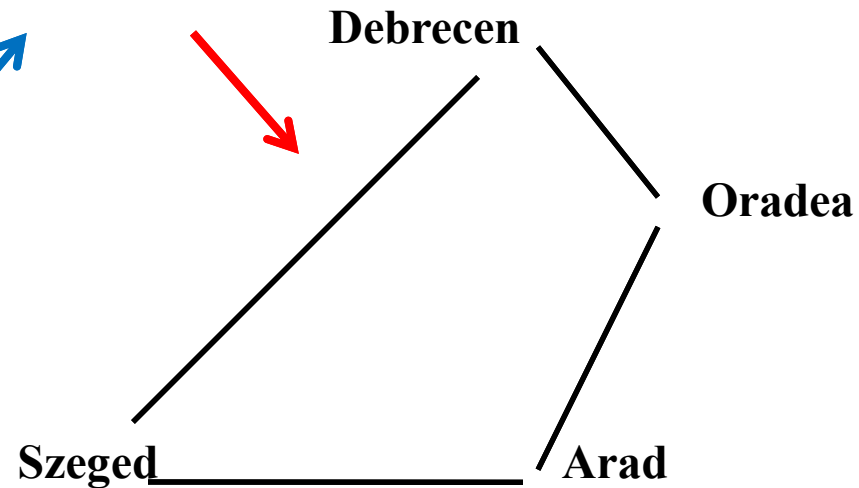

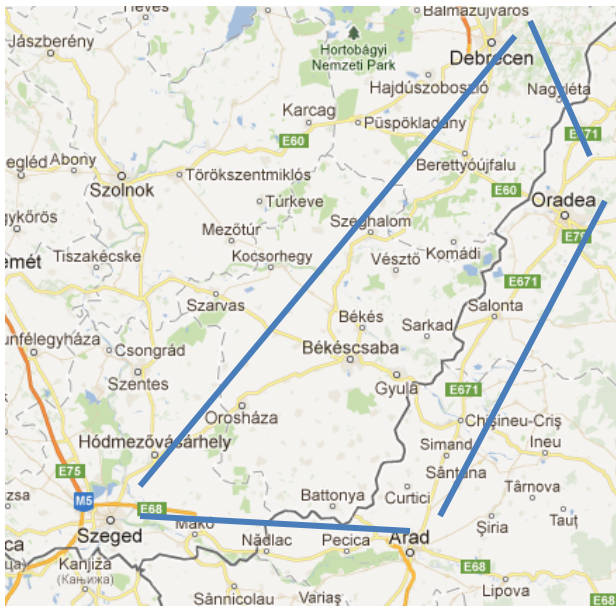

# Verification of the Structure

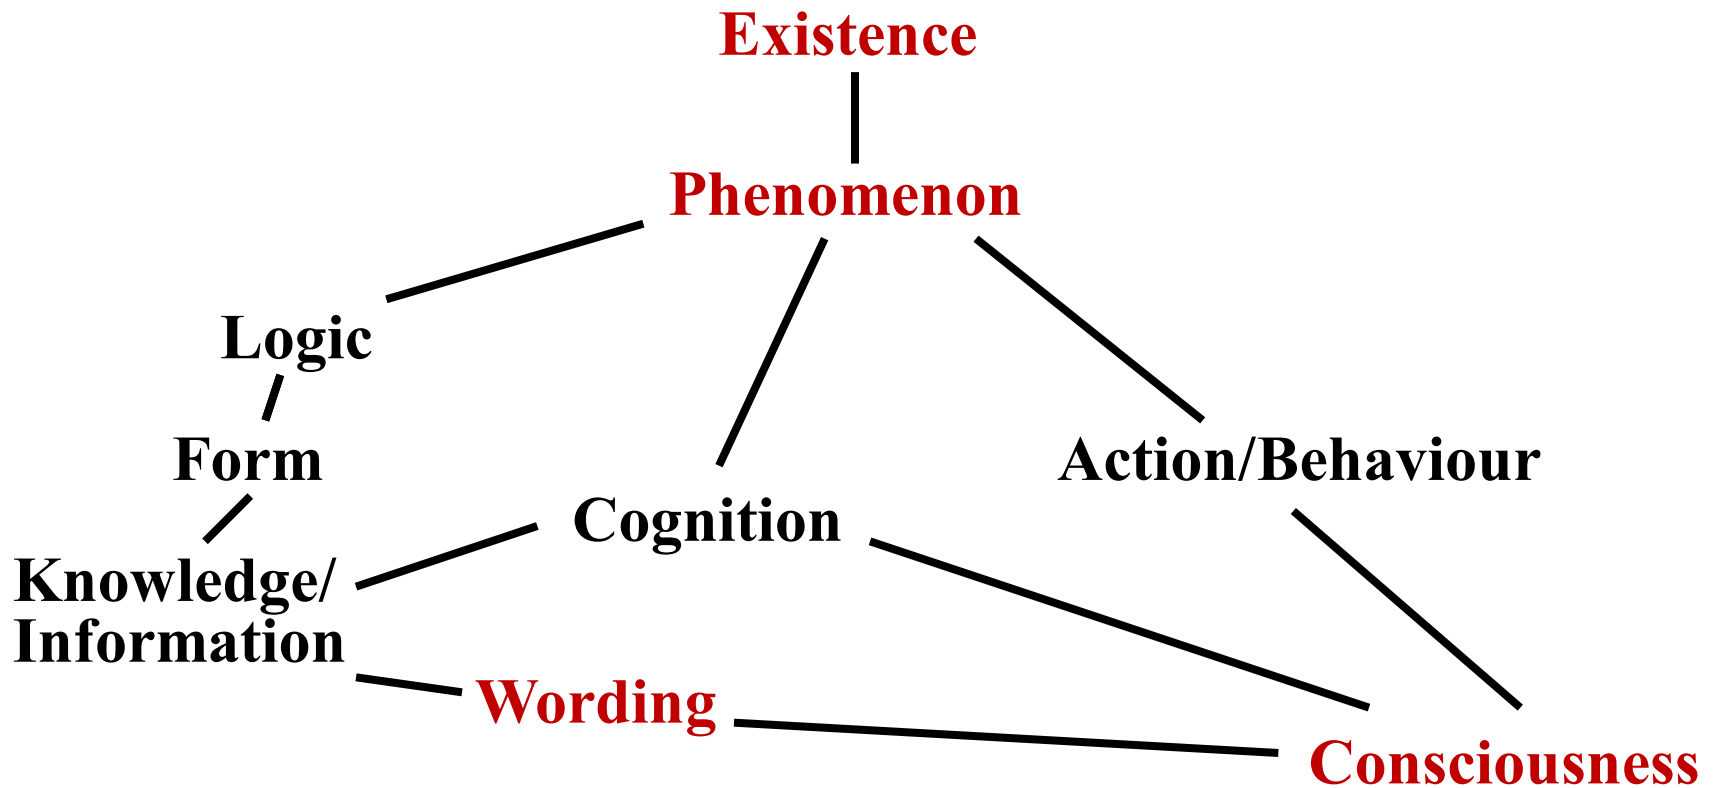

1. Conducted **psychological experiments** with five student-subjects to obtain similarities of adjectives by pair-wise comparisons.
2. Applied **'Multi-Dimensional Scaling for Qualitative Data'** to the experimentally obtained data and allocated adjectives on 2D space concerning the first and second eigenvalues.
3. Then applied **the cluster analysis with shortest distance method** to the above 2D data to identify the structure of uncertainty.

# MDS: Draw a map on 2D space based on city-distances

	Arad	Szeged	Oradea	Debrecen
Arad	0	105	115	190
Szeged	x	0	212	94,2
Oradea	x	x	0	75
Debrecen	x	x	x	0

# Identified Structure of Uncertainty (Takayanagi, Yamanoi & Sugeno 1992)

**Their mutual distances were also identified.**

# **Verification of Dominant Adjectives (1)**

## **— A large-scale corpus analysis —**

### **uncertain, obscure and vague**

**BNC: British National Corpus**

**100 million written and spoken words (the number of English words  
= about 1 million)**

**BCCWC: Balanced Corpus of Contemporary Written Japanese**

**100 million written words (the number of Japanese words  
= about a quarter million)**

**Corpus analysis in Quantitative Linguistics:**

**Frequency Analysis: counting the number of occurrences of a word,  
a phrase, etc.**

**Co-occurrence Analysis: finding examples of co-occurrence of a specific  
word with another word**

**Concordance Analysis: finding context in use of a word, ex., KWIC (Key  
Word In Context)**

## Frequency Analysis of Adjectives by BNC

ambiguous	3.5	837	17 / 67 = 84	×

\*Google translation, \*\* BNC , \*\*\* Webster

**RED: top ranking, BLUE: second ranking and BLACK: other rankings**

# Conclusions

- (1) We have collected adjectives implying various uncertainties in seven languages: English, Japanese, Chinese, German, French, Spanish, and Basque.**
- (2) The number of adjectives differs depending on a language; 430 is counted in the case of English.**
- (3) Classifying these adjectives by the KJ method, we have found seven categories of uncertainty, or nine (if sub-categories are counted), which are associated with modalities of uncertainty.**
- (4) Allocating the categories on 2D space, we have found structure of uncertainty.**
- (5) The results have been verified by experiments and corpus analysis.**
- (6) We have also discussed some linguistic and logico-philosophical issues.**

# Future Studies

- (1) Conduct **Psychological Experiments** with a variety of subjects (based on statistics) in representative languages selected from among language families to measure similarities of adjectives.
- (2) Define dominance among adjectives implying uncertainty and identify a couple of dominant adjectives.
- (3) Identify nouns belonging to each category and find adjectives associated with each noun by applying **Co-occurrence Analysis** and **Concordance Analysis** to a large-scale corpus.
- (4) Also find dominant adjectives in each category.
- (5) Identify structure of uncertainty in each language and compare them to elucidate **common structure**.
